Scrutinies, Workflow and Publication of results

The software used to communicate the results, publishes the data on the Internet as they are processed, automatically and in real time and in order of arrival.

The vote's counting system works independently from the method used to carry out the suffrage. The scrutiny can be carried out by retrieving information from the automated system, or by sending - through the digitalization of images - the Scrutiny Records completed manually by the election officials

Our service pays special attention to the adequate design of the Scrutiny Records, in order to provide special features that guarantee their authenticity and the simplest and most fluid process of data entry

In order to track the result processing progress, the systems updates its status as soon as it receives the information of each specific joint.
These changes in the status allow to know the degree of progress of the total results or any particular electoral section throughout the process of Provisional Scrutiny.
